

15119
Basalt (breccia attached)
14.1 grams

Figure 1: Rake sample 15119 (basalt fragment breaking free of sil breccia). Cube is 1 inch. S71-48776.

Introduction

Lunar sample 15119 is a rake sample from station 2 (Swann et al. 1972). Photos show it was partly a soil breccia and partly a basalt fragment (figure 1).

Petrography

Ryder (1985) gives the only description, describing a “microporphyritic texture” with small phenocrysts of olivine set in a “groundmass of granular-looking pyroxene enclosed in plagioclase” (figure 2). No mode is given.

Chemistry

Analyses by Fruchter et al. (1973) and Chappell and Green (1973) were repeated by Ryder et al. (2001) and

Neal (2001). The composition indicates that it is an olivine-normative basalt.

Other Studies

Gose et al. (1972) and Pearce et al. (1973) determined the intensity of remanant magnetization.

Processing

The basaltic portion (about half) broke free from the breccia.
